welding neck Flange	A welding neck Flange is similar to slip on flanges,however, socket welds have
	an internal recess on the inside diameter to allow for a smoother flow of the
	process fluid. The positive of this is that is creates a smooth bore with the
	proper welding and grinding. The negative of this type of flange is that it can
	be more expensive than a slip-on due to more intricate machining, and they can be less readily available than slip-ons due to the fact that the
	bottom half of the inside diameter must be made to the same schedule as the pipe that is being used (you must specify the schedule needed)
	These socket weld flanges were initially developed for use on smaller sizes
Size	of pipe at higher pressure ratings.
